

CareFlow: Automating Medication Support

Hackathon 2: Flow State

Nina Borutyńska

Amien el Azzouzi

Who CareFlow Is For?

Many older adults (65+) forget to take their medication, and that can affect their health.

Regular check-ins help catch problems early, for both them and the people who care about them.

Medication Reminders and Well-Being Check-ins

Hello Nina

Today

Morning check: Not yet

Evening check: Not yet

Please remember to take your medication.

How CareFlow Works

Automatic steps, with a real person always ready to help

Follow-up Reminders

If there's no response, we send a gentle follow-up reminder so people stay on track with their medication.

Emergency Alerts

If there's still no response, we alert their emergency contact and, with permission, their doctor (huisarts), so help can arrive quickly.

AI-Driven Notifications

If something looks urgent, we notify the person and their contacts right away, so they can act fast.

How the n8n Workflow Works?

- Trigger - starts the workflow when it's time for a check-in.
- AI Classification Node - reads the response and sorts it as normal, needs attention, or urgent.
- Conditional Logic - decides what happens next.
- Notifications - alerts the right people at the right time.

Built in n8n with 6+ connected nodes, including the AI node, and it all runs automatically. That's how CareFlow supports SDG 3: good health and well-being for everyone.

Ethical Reflection

Where Automation Should Stop

CareFlow can be wrong, late, or go down. That's why we trust it for reminders and check-ins, but never for medical decisions. A human always has to step in when it matters most.

Thank You
