A 35-second climate film
made with ComfyUI

AI for Good

Hackathon 4: Picture the Planet
SDG 13: Climate Action

Nina Borutyńska & Ahmet Ünlü

A new shirt every season, and the old ones pile up

- Football shirts are usually made from polyester, plastic made from oil
- Each polyester shirt creates about 20.56 kg of CO₂ over its lifetime, about the same as driving 140 km.
- Synthetic clothes cause up to 35% of microplastics in the ocean, and one 6 kg wash can release about 700,000 microfibrres.
- Recycling is not the fix: recycled polyester sheds about 55% more microfibrres than new polyester.

20 kg

CO₂ per shirt*
over its lifetime

140 km

about the same
as driving

35%

of microplastics
in the ocean

700,000

microfibrres released
in one 6 kg wash

*The 20 kg number is for a regular polyester T-shirt, so for a football shirt it is an estimate.
(RMIT University 2018, via ABC News 2023; Environmental Science & Technology, 2026; Scientific Reports, 2025; Changing Markets Foundation, 2025; Ajax home shirt 2025/26, Voetbalshop.nl)

Who is **this** film for?

For

football fans in the Netherlands, around **15–25 years old**, who buy the new club kit every season.

What they believe now

Buying the new shirt is part of supporting their club.
One shirt is small and harmless.

Where they see it

TikTok and Instagram Reels, in the week a club launches its new kit

Not for

people who already avoid fast fashion, because they already know this.

people who don't follow football, because the story would not work for them.

From shot list to film

1

Shot list

one prompt and one seed for each shot (8 shots)

2

MiniMax H3

turns each prompt into a video clip with sound

3

Z-Image-Turbo

makes the 2 text screens at the end

4

CapCut

we put the clips in order
no music and no AI voice

5

Film

Same look in every shot: every prompt ends with the same style line: "cinematic, desaturated cool colors, subtle film grain..."

Why RunningHub: our laptop has no strong graphics card, and Comfy Cloud's free version would not run our workflows. RunningHub runs real ComfyUI in the browser.

Watermark: removed only by cropping, never with another AI tool.

Anyone can remake our film: load our workflow JSON, paste the prompt and seed from the shot list, and click Run.

Starting in their world, then showing the **hidden cost**

Young fans won't read a report about textile emissions, but they recognise the moment of unpacking a new kit.

factory

stadium

Support your club. Not every new kit.

The ask is small and doable: wear your shirt one more season. It doesn't shame the viewer.

What could go wrong, and what **we did about it**

⚠️ RISK	✅ WHAT WE DID
The smoke over the stadium could look like a real fire or disaster.	Everything is made up: the factory, the chimneys and the stadium. Our README says nothing shown is a real place or event.
The AI added marks that looked like real sports brand logos.	We added "no badges" to the prompts and tried other seeds, but one logo that looks like Adidas is still visible in the film.
The AI chose the fan's face by itself. In our first version it kept making East Asian faces for "a young man", and once a young woman.	We changed the prompt to "a young Dutch man". The fan is not a real person, so no consent was needed.
The 20 kg number is for a T-shirt, not a football shirt.	We say it is an estimate.
Energy: 39 generations in total.	We tested at low quality, used 20 steps instead of 50, and reused clips.
HOW VIEWERS KNOW IT'S AI	Every shot has a "Generated by AI" label in the corner.

What we **learned**

AI is biased: it chose East Asian faces and once a woman, until we wrote "a young Dutch man".

AI ignores some instructions: it added logos even when we wrote "no logos".

Making AI video uses a lot of energy, so we tested at low quality and used fewer steps.

Not every tool works for free: we had to switch from Comfy Cloud to RunningHub.

**Thank you
for listening**
